Problem Statement: Build a tool that automates external recon (subdomains, open ports, tech stack, exposed panels) against a target you own/are authorized on.

Architecture

Abstract

Automated Reconnaissance

The project is an automated external reconnaissance tool designed for authorized domains.

Asset Discovery

The tool discovers subdomains, scans open ports, identifies the technology stack, detects exposed admin panels, and generates a risk-ranked security report.

Ethical Practices

It follows ethical cybersecurity practices by enforcing scope validation and respecting rate limits.

Purpose

Automate external reconnaissance.

Reduce manual security assessment effort.

Discover publicly exposed assets.

Identify technologies used by the target website.

Detect accessible admin panels.

Generate a risk-prioritized security report.

Ensure ethical scanning through authorized scope validation and rate limiting.

Thank You !
